

## QUESTIONS:

Can customers use more than one payment method? Ex: ½ on card ½ on cash

Should the order status and employee be connected since an order needs to show who was last modified by?

I'm pretty sure I messed up the status relationships, is

About the ERD:

- Attributes are placed inside the ERD in order to satisfy **“all relevant entities and their attributes are defined”** on the rubric

## RELATIONSHIPS:

- Customer is categorized based off status (active, inactive, banned, deceased (?), Status can only have one customer.
- Customer are grouped based off their type and they're only allowed to have one type (retail or corporate), TYPE entity can have more than one customer in that grouping
- Customer TYPE can have one or more addresses but the customer can only have one Type

## NOTES:

- I'm pretty sure I messed up the Status Relationships, A Status Entity Can have more than one customer right? We're basing it on the overall database thingy and not just an occurrence between a specific customer?
- I included Attributes in the ERD Diagram, I can add more attributes or remove them with wtv yall would prefer
- **Red Attribute/Text:** Not sure If I should Include these, if someone could confirm lmk lmk
- Relationships confuse me, I most likely messed a lot of them up, please feel free to point them out so I can fix it (thank you pls Imma cry I feel like I'm trying to think outside the box when trying to justify the relationship lol)
